Title : Mechanical pipe wrenches and their gears

Periodical : Energ. byul., #10, 1-9, 0 1954

Abstract : Construction details and kinematic scheme of action of various mechanical types of pipe coupling wrenches are briefly described. Special attention is given to the electrically or pneumatically-operated Molchanov wrench. The pipe coupling and uncoupling actions of the wrench are studied with the oscillograph. Three oscillograms and 1 diagrammatic arrangement.

Title : ~~On efficiency of electric drive used for drilling oil wells~~  
Periodical : Energ. byul, no.3, 22-25, Mr 1955  
Abstract : Analysing the articles of this title by T. Z. Portnoy and M. G. Yun'kov, published in this journal (no.1, 1955) and by Sulkhanishvili, I. N. and Shkol'nikov, B. M., published in this journal (no.2, 1955), the author presents his conclusions and suggests that: 1) the improvement recommended in both articles to be made in electric drives should be implemented as soon as possible;  
2) the driving mechanisms should suit the DC motors as closely as possible;  
3) controlled gas-tube rectifiers and inverters should be introduced for DC and induction drives.

TITLE: Some Features of Electro-Mechanical and Hydrodynamic Transmissions in Driving Drilling Mechanisms (O nekotorykh osobennostyakh elektromashinnykh i gidrodinamicheskikh peredach v prirode burovykh mekhanizmov); Results of the First Comparative Tests Under Industrial Conditions (Rezultaty pervykh sopostavitel'nykh ispytaniy v promyshlennyykh usloviyakh)

PERIODICAL: Energeticheskiy Byulleten', 1958, Nr 6, pp 1-11 (USSR)

ABSTRACT: The author discusses the uses and advantages of various types of transmissions between the drive source and the working mechanisms of drilling rigs. The normal diesel-mechanical transmission with gears is contrasted with the electro-mechanical (generator-engine) and the hydrodynamic (turbo-transformer). Tests under industrial conditions were carried out with a 5 DE drilling rig coupled to a DEB-1 diesel-electric transmission, a 5 DTP rig with TP-2-300 hydraulic transmission and a 5 D rig with diesel-mechanical drive. Graphs showing the changes in the average speed of the hoist were drawn up. Performance and characteristics of the different assemblies are discussed and some improvements suggested. The test results

Card 1/2

Some Features of Electro-Mechanical and Hydrodynamic Transmissions in  
Driving Drilling Mechanisms

90-58-6-1/7

indicate that the use of a reduction transmission (electric or hydraulic) in the drive to the drilling winch greatly increases the productivity of the hoist system and improves the operating conditions of the engines. Their use in the drive to the rotor helps to solve some constructional snags while in the case of drilling pumps it is best to use a smoothly governed drive with limited torque, though a hydraulic and electric reduction transmission is justified in several special cases. There is 1 block-diagram, 10 graphs, 1 table and 2 Soviet references.

TITLE: On some ways of improving the external memories of computers

SOURCE: AN AzerbSSR. Vy\*chislitel'ny\*y tsentr. Trudy\*, v. 2, 1963, 151-161

TOPIC TAGS: computer memory, magnetic storage, magnetic tape, digital computer

ABSTRACT: The article deals with the use of a group of external magnetic-tape memories to supplement the information that must be stored in the internal operative memory. The system consists of two standard tape recorders (MEZ-15 and MEZ-28A), so modified that control pulses can be used to turn the motors on and off and to reverse the motor. The motors operate at 762 mm per second in both directions. Standard type-II tape is used and the recording density

1/3

ACCESSION NR: AT4042333

is four pulses per millimeter. This ensures reading and writing of 3000 pulses per second. Sequential reading is used, and the writing of each code position is accompanied by a synchronizing pulse. The synchronizing pulses are recorded on a separate track. A gap of three synchronizing pulses is left between words. The control of the external memories can be either automatic (programmed) or manual (from the panel) and consists of the operations of writing, direct reading, backward reading, backward search before reading, direct search before reading, forward search before writing, reverse search before writing. The operation of the control system is described in detail. The operation has shown good results, with provision made for monitoring, indicating the end of the tape, different types of search, etc. Whatever breakdown occurred was due to poor tape quality. The control system was developed jointly by a member of the Azerbaydzhan Academy Computation Center (Yu. A. Makhmudov) and members of the Electric Analog Laboratory of VINITI AN SSSR (Ya. I. Shturman and Ya. I. Posternak) and was built in the

TITLE: A device for reading and printing <sup>ibc</sup> alphanumeric information from punched cards (USP 1) <sup>23/8</sup>

SOURCE: Nauchno-tehnicheskaya informatsiya, no. 1, 1965, 29-31

TOPIC TAGS: programming, data processing, computer, computer input device, computer output device, printing, punched card / USP-1 punched card unit, Ural 4 computer

ABSTRACT: The author describes the USP-1 machine for reading alphanumeric information from punched cards and printing decoded information on printer rolls. The device is undergoing development at the Laboratoriya Elektromodelirovaniya VINITI AN SSSR (Laboratory of Electro-Simulation, VINITI, AN SSSR). Code forms, compatible with those used for the Ural-4 computer, are shown in a table. About 200 standard ferrite-diode modules are used in the reader-printer control system construction. The following functions are performed by the device: 1) automatic feeding and relay of punched cards, 2) printing of alphanumeric text, 3) resetting of information registers and typewriter carriage return, as designated by

Card 1/2

the proper control codes on punched cards. Otherwise, carriage return is caused by printing in the right-most field of the typewriter paper roll. Reliability controls are installed to stop printing and reading in case of certain malfunctions. The device is capable of handling both Russian and Latin text characters, plus selected Greek letters, Arabic and Roman numerals, punctuation marks, arithmetic and other symbols, for a total of 86 characters in all. The same character dictionary is used in both input and output modes. Printer speed is 10 characters per second. The typewriter paper roll is 170 characters wide, and the total length of the roll is 50 meters. A block diagram of the functional units of the device is given. Orig. art. has: 1 table and 1 figure.

Availability of phosphorus for plants in connection with various periods and conditions of interaction of fertilizers with the soil. P. A. Dmitrenko and V. S. Shurinova. *Doklady Akad. Nauk S.S.S.R.* 76, 447-50(1981).—A review with 16 references. With meadow-cheremom soil cultures fertilized either directly before planting or 7 months previously, it was shown that with adequate watering no difference in P availability exists between the 2 variants, although the 7-month soil gives somewhat slower initial plant growth. If the soil is 100% smtd. with  $H_2O$ , however, the 7-month-old P fertilizer is more available to the plants as shown by more luxuriant growth and P content of the plants. P was used as the 20%  $P_2O_5$  form of superphosphate. G. M. K.

**Determination of copper in steels with the aid of the spectroscopic.** P. D. Kuzh and M. N. Shitman (Magnitogorsk Metallurgical Combine). *Zavodskaya lab.* 13, 104-1 (1947).—A 230-v. d.-c. arc at 3 amp. was used for excitation. The sample acted as anode; the cathode was an Fe rod. After a 2-min. pre-arc, the Cu line at 5105.0 Å. (1) was compared with the Fe lines at 5007.0 (2), 5098.7 (3), 5107.6 (4), and 5127.4 Å. (5), and the Cu at 5153.2 Å. (6) with Fe at 5151.9 Å. (7). For Cu,  $1 > 2$  and  $0 < 7$ ; for 0.10% Cu,  $1 \leq 3$ ; for 0.18% Cu,  $1 > 2$  and  $0 < 7$ ; for 0.23% Cu,  $1 = 3$  and  $0 < 7$ ; for 0.29% Cu,  $1 = 3$  and  $1 < 3$ ; for 0.42% Cu,  $1 \geq 3$  and  $0 < 7$ ; for 0.50% Cu,  $1 > 3$  and  $1 < 4$ ; for 0.57% Cu,  $1 \leq 4$  and  $1 > 2$ . Agreement with chem. analysis was excellent. C. F.

COMMON ELEMENTS	<p>Spectroscopic determination of sodium in fireclay and in clays. P. D. Korzh and M. N. Shtutman (Magnitogorsk Metallurg. Combine). <i>Zashchita</i> Lab. 13, 441-7 (1947).—In 3- and 8-amp. arcs, 10- and 80-mg. samples of fireclays and clays emitted the Na<sub>2</sub> doublet in discontinuous flashes over the whole duration of the evapn. of Na (5-6 min.). Single uninterrupted emission, suitable for quant. detn., is obtained by mixing the material with CaSO<sub>4</sub> (1:1 to 1:4); provided the ingredients are mixed intimately, Ca lines will appear only after the Na emission is over; this takes place at the very beginning of the evapn. and its duration <math>\tau</math> gives the amt. <math>c</math> of Na, e.g. (10-mg. samples), 0.00, 0.18, 0.23, 0.28%, <math>\tau = 12, 18, 23, 39.5</math> sec.; empirically, <math>\log \tau</math> is proportional to <math>c</math>. The material should be dil'd. with a Na-free slag or SiO<sub>2</sub> to contain 0.1-0.4% Na<sub>2</sub>O. Clay should be preliminarily dehydrated at 500° for 15 min. The uncertainty in the detn. of <math>\tau</math> causes only an error of <math>\pm 0.005\%</math> in Na. However, detns. on clays with known amts. of NaCl added artificially gave results 0.03-0.05% too low; hence, the strict proportionality of <math>\log \tau</math> and <math>c</math> holds only for the chemically bound Na in clays; addn. of sol. Na salts affects primarily the intensity of the line. In mixts. of sol. Na salts with an open-hearth slag, only the intensity varied markedly with the Na content (0.2-0.5%); <math>\tau</math> remained practically const. On the other hand, with mixts. of basic slags (CaO, SiO<sub>2</sub>, and FeO in varying proportions) with Seger cones (13.8% Na<sub>2</sub>O in the form of Na feldspar), the variation of <math>\tau</math> with <math>c</math> (0.2-0.6%) was the same as in clays mixed with CaSO<sub>4</sub>, except that the <math>\tau</math> were shorter. The proportionality between <math>\log \tau</math> and <math>c</math> is characteristic of silicate-bound Na. From comparisons of the effects of slags of various compos., it follows that FeO accelerates evapn. of Na in the arc even more strongly than CaO, whereas SiO<sub>2</sub> tends to slow it down. N. Title        :    Use of solutions during spectral determination of admixtures in steel and refractories

Periodical   :    Izv. AN SSSR. Ser. fiz. 18/2, 271-272, Mar-Apr 1954

Abstract     :    Brief announcements are made on the development of methods for the determination of non-metallic inclusions in carbon steel and  $Al_2O_3$ , CaO, MgO admixtures in Dinas brick and in quartzite. In determining inclusions in steel the sample is dissolved in such a way that the non-metallic inclusions (silicates, spinel, free oxides and sulfides) settle in the residue and the metals are transformed into solution. By subjecting the residue to various reagents it becomes possible to separate the nonmetallic inclusions into phase components and then transform them into solution. The same applies to refractories. One USSR reference (1950).

PHASE I BOOK EXAMINATION

Ural'skiye sovetskaniye po spektrom

Materialy 2 Ural'skogo sovetskaniya po spektroskopii, Sverdlovsk, 1958 g. (Materials of the Second Ural Conference on Spectroscopy, Held in Sverdlovsk, 1958) Sverdlovsk, Metallurgizdat, 1959. 206 p. Kravatskiy in-  
series. 1,000 copies printed.

Sponsoring Agency: Ural'skiy filial Akademii nauk SSSR. Komissiya po spek-  
troscopii i Ural'skiy dom tekhniki VNTO.

Eds.: Prof. Borisovich Shagvich and Genusiy Pavlovich Koryukov, Tech.  
Sci., N. N. Nizhny.

PURPOSE: This collection of articles is intended for general analytical labo-  
ratory workers at ferrous and nonferrous metallurgical plants, and for labo-  
ratory personnel of the metal-working industry engaged in technological and prospecting  
organizations, and similar scientific research laboratories.

COVERAGE: The collection contains papers read at the Second Ural Conference  
on the spectral analysis of ferrous and nonferrous metals and alloys,  
slag, ores, agglomerates, and other materials used in in-  
dustry. The material of the conference includes articles on the analysis  
of slag, including the determination of gases, ferroalloys, nonfer-  
rous and light metals and alloys, pure noble metals, etc. The present  
volume is intended to disseminate the latest experience in working with  
spectral laboratories, and to report on the results of scientific re-  
search. The author thanks N. I. Outkina and Yu. M. Muraviev. Almost all  
of the articles are accompanied by references.

(2)  
The adenosinetriphosphatase of brain. A. V. Palladin and Ts. M. Shtutman (Inst. Biochem., Acad. Sci. Ukr. S.S.R., Kiev). *Ukrain. Biohim. Zhur.* 20, 311-20 (in Russian, 320-1) (1948).—Th: adenosinetriphosphatase (I) of brain can be extd. with distd.  $H_2O$  in the ratio 1:20. Its optimum activity is at pH 7.4-8.0. The activity of I in aq. rabbit-brain exts. at acid pH is higher in glycine (II) buffer than in barbital buffer, since II protects the enzyme against denaturation by acids. The I of brain is activated by  $Mg^{++}$ , but not by  $Ca^{++}$ . Cysteine and  $ICH_3COOH$  do not affect its activity,  $NaF$  depresses it. I is less sensitive toward the ions of the medium than is I bound to myosin. The aq. exts. of rabbit and cattle brains remove both labile phosphate groups from adenosine:riphosphoric acid; the cattle brain exts. also split adenylic acid and inosinephosphoric acid. The I of rabbit-brain ext. is bound to 2 protein fractions which can be pptd. by addn. of 0.01 and 0.4N  $Na_2SO_4$ , resp. If exts. and ppts. are dild. with 0.01N  $Na_2SO_4$ , the activity of I is increased; this does not occur if the centrifugate is dild. In the same way. Conclusion: In rabbit brain there is an inhibitor for I which ppts. upon addn. of 0.01N  $Na_2SO_4$  almost completely from the aq. ext. together with part of the enzyme.

✓ The distribution of bromine in the nervous system following the administration of bromides. Ts. M. Shutman, Ukrain. Biokhim. Zhur. 26, 64-6 (in Russian, 63-67 (1952)). Following any method of bromide administration, Br reaches a max. in the blood in 3 hours and in various parts of brain in 17 hrs. Three hrs. after the bromide administration the white matter absorbs Br at a rate higher than any other part of the central nervous system (on the wet-weight basis). Approx. 6 days later more Br is found in the gray matter of the cerebral hemispheres. Generally and in the long run, more Br is found in the gray matter than in any part of the brain. The peripheral nervous system manifests the highest affinity for Br. Here the Br absorption is rapid and its percentage content may reach that of the thyroid gland. B. S. Levine

Bromine metabolism in manic-depressive psychosis. P. V. Biryukovich and T. M. Shutman, (O. O. Bogdanovskii Inst. Physiol., Kiev). *Fiziol. Zhurn. Akad. Nauk Ukr. R.S.S.R.* 1, No. 5, 54-60 (Russian summary 60) (1955). The Br content of blood and urine was detd. by the method of Th. Leipert and O. Watzlawek (*C.A.* 28, 6383). The av. of normal value was 0.280 mg %. The blood Br content of manic-depressive patients in the remission stage as well as during the manic and depression phases was characteristically low, being lowest during the period of attack. A temporary normalization of the level of blood Br occasionally occurred during the remission stage, showing a greater stability in remissions of longer duration. In some patients there was a considerable reduction in blood Br just prior to an attack. The lowering in blood Br content is paralleled by its increase in the urine, and vice versa. R. S. Levine

S. H. T. U. I. M. A. N. - 13. 14.

Effect of phenamine and of adrenaline on the elimination of halogens in rabbits. Ts. M. Shtutman and V. Yu. Sokolova (Inst. Biochem., Acad. Sci. Ukr. S.S.R., Kiev). *Ukrain. Biokhim. Zhur.* 27, 469-76 (Russian summary, 475-6) (1955).—This study was made to detn. the effect of injection of sympathomimetic substances (phenamine and adrenaline) on the elimination of Br and Cl via the urine. A single subcutaneous injection of 16 mg. of phenamine into rabbits considerably increased the excretion of Br and Cl while repeated injections sharply lowered their elimination. Injection of 0.25–0.5 mg./kg. of adrenaline likewise augmented the elimination of Br and Cl. A repeated single injection of this drug a day apart arrested the elimination of Br and sharply reduced the elimination of Cl in the majority of instances. Upon repeated daily injection of adrenaline the level of Br elimination rose during the first 24–48 hrs. and of Cl during 4–5 days, followed by the lowered elimination of both substances. The ratio of Br/Cl concn. in the urine was not a constant function; in some instances the ratio was completely reversed. B. S. Levine

The Sixth Conference of Young Scientific Workers of the Institute of Geography AS USSR (Institute of Geography AS USSR)

Investiya Akademii nauk SSSR, Seriya Geograficheskaya, 1959, No. 4, pp 152-154 (USSR)

ABSTRACT:

The article covers the Sixth Conference of Young Scientific Workers of the Institute of Geography AS USSR which took place in mid-March, 1958. 35 reports were read by the following scientific workers: I.S. Glushko reported on "Some Genetic Regularities in the Distribution of Atmospheric Precipitation", V.K. Kotlyakov and S.I. Lesovoy examined the structural development of snow cover in the mountains of the Caucasus, and the role of the network of watercourses in the formation of the snow cover and the latest tectonic movements in the Northern Trans-Ural area. I.P. Ochinnikova evaluated the evaporation according to the water balance method from the African continent; A.Ya. Kirova discussed evaporation problems in the Gulf of Kara-Bozaz-Gol; L.N. Lebedeva and Ye.M. Minayeva reported on the impact of solar radiation on snow during its melting in the Trans-Volga region; A.Y. Yachin spoke on snow radiation near the Siberian Weather Station; M.K. Garkava lectured on snow conditions in the mountains of Central Caucasus; K.N. Orlov reported on his own work on the measurement of snow cover by a photoelectric device; Yu.I. Rudnev, A.Ya. Kirova, and A.I. Rudnev spoke on the water balance observations they compiled at the Zaporskiy Scientific Station near Moscow; G.V. Baas lectured on spring water discharge and soil washout also studied there; M.M. Dreyer and I.M. Stezhenskaya lectured on how to calculate the maximal spring water discharge in the Yenisey and Lena rivers according to the method of V.I. Vasil'yev; A.Y. Nikolayeva lectured on sea levels of the Caspian sea during the 7-19 centuries and Z.I. Matrosov on the lake levels in the Turgy depression during 1849-1958; L.I. Mukhina reported on the rivers and lakes of the Vitya plateau; K.I. Stravinsky lectured on the formation of the snow cover in the valleys of the Zuna basin; I.I. Valichko elucidated on loess deposits in the central areas of the Russian plain; D.I. Mil'man lectured on "Torrent-Like Phenomena in Dzheshant" and A.Ye. Yermakov on "Glaciation of Torrents in Central Caucasus"; A.G. Chikina gave a Geobotanic survey of the Central Ural; I.M. Sturina lectured on the division of the Trans-Ural wood-ani-stoppe area into single relief types.
